

PHP Test Project

✓ Online Course Subscription with Online Payment

Project Overview

This PHP project lets users:

- Browse and subscribe to online courses
 - Pay using SSL-compliant payment gateways (e.g., **SSLCommerz**, **Sandbox**)
 - Track their subscription status
 - Access purchased course content
 - Receive invoices or receipts
 - Admin panel for admin
-

Data Model (ERD in Text)

Users

- id (PK)
- name
- email
- password
- role (student)
- created_at

Courses

- id (PK)
- title
- description
- price
- duration (in weeks/days)
- thumbnail_url
- created_at

Subscriptions

- id (PK)
- user_id (FK → Users)
- course_id (FK → Courses)
- status (active, expired, cancelled)
- started_at
- expires_at

Payments

- id (PK)
- user_id (FK → Users)
- subscription_id (FK → Subscriptions)

- amount
- payment_method (sslcommerz/stripe/etc.)
- transaction_id
- status (success/failure/pending)
- created_at

CourseContent

- id (PK)
 - course_id (FK → Courses)
 - title
 - video_url
 - type (video/pdf/quiz)
 - created_at
-

DFD (Level 1)

```
[User]
  → (Register/Login) → [Auth Controller] → [Users DB]
  → (View Courses) → [Course Controller] → [Courses DB]
  → (Subscribe Course) → [Subscription Controller] → [Subscriptions DB]
  → (Initiate Payment) → [Payment Gateway API (SSLCommerz Sandbox)] →
[Payments DB]
  ← (Payment Callback/Webhook) ← [Payment Gateway]
  → (Access Course Content) → [CourseContent Controller] → [CourseContent
DB]
```

SSL Payment Integration Flow

For example, with **SSLCommerz (Sandbox)**:

1. User clicks “Pay Now”
2. PHP sends payment data to SSLCommerz API
3. User is redirected to SSLCommerz hosted page
4. On success/failure, SSLCommerz redirects to your callback URL
5. Callback handler:
 - Verifies transaction (via API or IPN)
 - Updates `Payments` and `Subscriptions` tables

Tech Stack Recommendation

- **Backend:** PHP (Laravel preferred for routing, ORM, and MVC)
- **Frontend:** HTML, CSS, Bootstrap, React (optional)
- **Database:** MySQL
- **Payment Gateway:** SSLCommerz (Sandbox Process)
